Circuit Implementation

Recommended Single Ended Drive Circuit

Recommended gate drive: (0 V, 12 V) with $R_{G(\text{tot})} = 11 \Omega$, where $R_{G(\text{tot})} = R_G + R_{\text{Driver}}$

Gate Ferrite Bead (FB)	Gate Resistance1 (R_G)	RC Snubber ($R_{C_{SN}}$)
MMZ1608S301ATA00	10 Ω	47 pF + 15 Ω

Notes:

- d. R_{Csn} should be placed as close as possible to the drain pin
- e. The layout and wiring of the drive circuit should be as short as possible

Design Considerations

Fast switching GaN device can reduce power conversion losses, and thus enable high frequency operations. Certain PCB design rules and instructions, however, need to be followed to take full advantages of fast switching GaN devices.

Before evaluating Runxin Micro’s GaN devices, please refer to the table below which provides some practical rules that should be followed during the evaluation.

When Evaluating Runxin Micro’s GaN Devices:

DO	DO NOT
Make sure the traces are as short as possible for both drive and power loops to minimize parasitic inductance	Using Runxin Micro’s devices in GDS board layouts
Use the test tool with the shortest inductive loop, and make sure test points should be placed close enough	Use differential mode probe or probe ground clip with long wires
Minimize the lead length of TO packages when installing them to PCB	Use long traces in drive circuit, or long lead length of the devices
